

INTEGRA Static Public IP addresses

A Static Public IP address can be used to make a terminal directly reachable from the Internet and/or to make a terminal have a unique IP address when accessing the internet.

Once the Static Public IP address has been allocated you will be informed, and your terminal will automatically use this IP address.

By default, all inbound access to the terminal will be blocked by the INTEGRA network firewalls.

To facilitate remote access to the terminal the relevant inbound firewall rules must be requested.

Notes

Static Public IP addresses are chargeable on a monthly basis and there is a minimum 1-month charge.

Static Public IP addresses are not required for terminal to terminal communication.

If you wish to remotely access your terminals, a public IP address is not always required – other methods and technologies are available that may be more suitable and cost effective. Please contact your Account Manager for further information.
